HireRoom: Product Plan

Company posting, candidate flow, Campfire, repos, build phases, AI prompts, and a recording guide for the two agent videos. Prepared 4 Nov 2026.

1. The idea

HireRoom is a hiring platform where a company posts a job, an internship or an open challenge in under two minutes. Candidates apply or enter with one profile, and everything after that happens inside HireRoom: no pasted links, no spreadsheets, no WhatsApp groups. There are no Round 1/2/3 stages. A listing has applicants; the company shortlists and hires. Every listing gets its own Campfire room where applicants and the company can talk.

Suggested niche: hire by proof, not by resume. Built for startups and small teams that cannot run an enterprise hiring suite: post a role or a mini-challenge in four questions, then review verified applicants and real work samples in one inbox. (This is my recommendation, not something the research proves. See the decisions in section 8.)

1	2	3	4	5
Company posts in 4 questions	Listing goes live (verified badge)	Candidate applies or enters challenge	Campfire room opens for the listing	Company shortlists and hires

2. How hiring works today

What the research found, so HireRoom starts from what companies already expect.

Posting flows

- **Internshala** (from its own employer guide): create an employer account, add a title and description, set location and job type, add stipend or salary, list skills, set a deadline, add the company profile, and upload supporting documents. The guide does not say which fields are mandatory or mention screening questions. Source
- **Unstop** (employer pages): listings with an AI-generated job post option, eligibility and screening questions, a no-code company microsite, role-specific assessments with proctoring, a built-in applicant tracking system, interview scheduling and offers. It also runs hackathons and challenges for employer branding. Its own marketing claims a 32M+ community and 42K+ colleges. Source, Source

Trends that matter

- **Skills first.** The TeamLease EdTech career outlook for the first half of 2026 (1,051 employers) reports 73% employer intent to hire freshers and a shift from degree filters to skills and proof-of-work: internships, projects, portfolios and hackathons. Source
- **Trust is broken.** In an Indeed survey of 1,161 Indian workers (reported July 2026), 93% had met suspicious job offers and 51% were not confident they could tell real recruiters from scammers. Verifying the recruiter's identity was the top trust signal at 50%. Source

What this means for HireRoom

You cannot beat Unstop on reach, so win on four things: a posting flow that takes four questions, challenges that produce proof of work, verified companies that candidates can trust, and one place for everything.

3. The company section

Company onboarding (3 inputs)

- **Website URL.** HireRoom reads the site and pre-fills the company name, logo and a one-line description. The company edits anything that looks off.
- **"What do you do, in one line?"** Pre-filled from the site if possible.
- **City or Remote, and team size** as tap-to-pick pills.

Verification: the work email must match the website domain to earn the Verified badge, and an admin reviews the first listing before it goes live.

Posting flow (4 screens)

The company first picks a type: **Job**, **Internship** or **Open challenge**. Then one question per screen:

Screen	Question shown	Input
1	What are you hiring for?	Role title
2	What will they do? Two lines is plenty. (Challenge: What should they build or solve?)	Short free text
3	What should they be good at?	AI-suggested skill chips, tap to add
4	The practical bits	Pay (range or fixed), Remote / On-site / Hybrid pills, deadline. Challenge adds prize or stipend and max attempts.

Then AI writes the full listing: about the role, what you will do, what you need and, for challenges, a scoring checklist. The company previews it, edits inline and publishes. A live card preview sits beside the form while they type.

Make the forms fun

- One question per screen, big type, Enter to continue.
- Live listing-card preview that fills in as they type.
- AI skill chips and smart defaults, so most answers are one tap.
- Friendly progress text ("3 of 4, almost there") and plain-language microcopy.
- Autosaved drafts, and every optional field can be skipped.
- A small celebration when the listing goes live.

Company dashboard

- **My listings:** draft, pending review, live, closed.
- **Applicants inbox:** one card per candidate with an AI summary, skills, challenge score and submissions. Actions: Shortlist, Hire, Reject, Message.
- **Company page:** edit logo, one-liner, team photos and open roles.
- **Campfire:** one room per listing. **Stats:** views, applied, shortlisted.

HireRoom admin

Approve companies and listings, handle reports, remove spam and feature listings.

4. Why companies stay

Benefit	What HireRoom does	Why it matters
One place for everything	Post, receive, review, message, shortlist and hire inside HireRoom.	No scattered email, sheets or chat groups.
Two-minute posting	Four questions, then AI writes the listing.	Long forms are why small teams avoid posting.
Proof of work	Challenges produce real submissions with a scoring checklist.	Matches the skills-first trend in the TeamLease report.
Trust	Verified company badge and verified candidate profiles.	Scam fear is high among candidates (Indeed survey).
AI-ranked inbox	A summary and match rating with reasons per applicant.	Saves screening time. A person always makes the call.
Employer brand	Free company page plus a Campfire room for each listing.	Candidates see the team before they apply.
Simple pricing	Free to start (see decisions in section 8).	Low risk for a company to try.

5. Candidate side and Campfire

Candidate flow

Reuse the Startupathon pattern from the screenshots: quick onboarding questions, resume upload parsed into an editable profile, browse listings, then **apply in one tap** (the profile is the application, plus up to two optional screening questions from the company) or **enter a challenge**, work on it, and submit.

Nothing leaves HireRoom

- Resume, photo and company briefs are uploads, not links.
- Challenge submissions are uploaded files or a zip, written notes and screenshots.
- Code: the candidate connects GitHub once and **picks a repo from a list** instead of pasting a URL.
- Walkthrough video: record in the browser or upload a file (phase 3).
- Links can exist as optional fields but are never required, and there is no "apply on our website" button.

Campfire

- A room is created automatically for every listing.
- Anyone who applies or enters the challenge is added. Company members are hosts.
- Pinned announcements and Q&A. No direct messages in v1.
- Report, mute and remove tools for moderation. The room goes read-only when the listing closes.
- Start with the Supabase Realtime Chat block plus a messages table, so history is stored.

6. Data model

Table	Key fields
users	id, email, role (candidate, company, admin)
candidate_profiles	user_id, name, headline, location, skills, education, experience, resume_file, github_connected
companies	id, name, website, logo, one_liner, city, size, verified, status
company_members	company_id, user_id, role
listings	id, company_id, type (job, internship, challenge), title, summary, body, skills, pay, location, deadline, status (draft, pending_review, live, closed), challenge_brief, scoring_checklist, max_attempts, prize
applications	id, listing_id, candidate_id, status (new, shortlisted, hired, rejected), answers, ai_summary, match, created_at
submissions	id, application_id, version, files, repo, notes, scores, created_at
rooms, room_members, messages	room per listing; members; message body, author, created_at, pinned
reports	id, reporter_id, target_type, target_id, reason, status

7. Repos to build on

Need	Repo	License	How to use it
App base: dashboard, tables, kanban	next-shadcn-dashboard-starter (7.2k stars)	MIT	Start here. Next.js 16, Tailwind v4, shadcn/ui, TanStack Form + Zod. Swap Clerk for Supabase auth.
Public listings, search, SEO, email alerts	Bordful	MIT	Reference for listing pages, filters, feeds and alerts. It stores jobs in Airtable, so replace that with Supabase.
Fun 4-question forms	Build it yourself with TanStack Form, Zod and Motion (Framer Motion)	n/a	Simplest and no license risk. See the note below.
Challenge attempts and scoring	CTFd	Check repo	Reference for attempts, submission history and scoring. Not code to fork.
Campfire chat	Supabase Realtime Chat block; Campfire	Campfire: MIT	Use the Supabase block in-app and add a messages table. Campfire is a reference for rooms and mentions.
Pipeline reference	OpenCATS, FreeATS	FreeATS: MIT	Data model ideas only.
Email (auth and event emails)	React Email (19.6k stars) + Resend	React Email: MIT	Write templates as React components and send them through Resend. Details are in the setup guide.
Resume parsing	Claude API with structured output	n/a	Extract PDF text, then fill the profile form. Avoids OpenResume's AGPL.
Database, auth, storage, realtime	Supabase	n/a	One backend for everything.

Form tools to avoid copying: Typebot is source-available under the Functional Source License (it converts to Apache 2.0 two years after each release and bars offering a competing managed form service), and the Formbricks core is AGPLv3. Use both as inspiration for the feel, not as code.

8. Build phases and decisions

Phase 1: foundation

Supabase auth for candidates and companies (email link and Google sign-in), transactional emails (welcome, application received, shortlisted, hired), brand tokens, company onboarding, the 4-question posting flow with AI-written listings, public listing pages with search, candidate onboarding with resume parsing, one-tap apply, and the applicants inbox with shortlist, hire and reject. **Done when** a company can sign up and post a job in under two minutes, a candidate can apply, and the company can shortlist.

Phase 2: challenges and Campfire

Challenge listings, submissions with uploads and the GitHub repo picker, attempts and deadline, the scoring checklist, a Campfire room per listing, and notifications. **Done when** a candidate can enter a challenge, submit, appear in the company inbox and chat in the room.

Phase 3: trust, AI and growth

Company verification and admin review, AI applicant summaries, email alerts, in-browser video recording, analytics, and payments if you decide to charge.

Decisions for you (with my recommended default)

Decision	Recommended default
Who is it for first?	Freshers and early-career candidates, and startups hiring them.
Pricing	Free for the first 2 live listings. Paid for more listings and featured placement.
Can candidates message companies directly?	No in v1. Room messages only.
Do candidates see AI scores?	No. Company-only, always with reasons, and a person decides.

9. Two videos to record for the agent

I cannot record these for you because they need your own logged-in screen. Record them yourself with Loom or OBS, keep each under 5 minutes, and talk through what you like and what HireRoom should do differently. Also export the transcript, since not every coding agent can watch video; the PDFs stay the visual source of truth. Hide your phone number and any passwords.

Video 1: 01-candidate-journey (Startupathon)

1. Open the first onboarding question and answer it out loud.
2. Show the what-are-you-looking-for screen, then the resume upload.
3. Show the building-profile loading screen and the review form.
4. Walk the dashboard: stats, banner, open roles.
5. Open a challenge page and scroll the whole thing slowly.
6. Click Enter the challenge, then show Connect GitHub.
7. Show the submit page: attempts, countdown, the form fields.
8. Say where it feels slow or confusing, and what HireRoom should skip (especially pasting links).

Video 2: 02-company-journey (Internshala and Unstop employer side)

1. Open the Internshala employer posting flow and start the employer sign-up.
2. Go through the post-a-job form field by field and say which ones feel boring or long.
3. **Stop at the preview. Do not publish a fake listing on a real platform.**
4. Open the Unstop employer pages (listings, screening questions, branding, hackathons) and show what is publicly visible.
5. Show any applicant dashboard or sample screens they publish.
6. Finish by saying how HireRoom does the same in four questions with AI writing the listing.

10. AI prompts for HireRoom

Two prompts power the product. The first writes listings and asks for missing context; the second helps a hiring team read applicants without making the decision for them. The prompts for the coding agent are in AGENTS.md and PROMPTS.md in the kit.

Prompt A: Listing Writer (company types 3 to 4 lines)

```
SYSTEM
You are HireRoom's listing writer. A company typed a few short lines about a role. Turn
  them into a clear, honest listing for candidates in India.

Rules:
- Use only what the company wrote. Never invent salary, benefits, location or
  requirements.
- If something essential is missing (role title, what they will do, location or remote,
  pay), ask at most 2 short follow-up questions and wait. Otherwise write the listing.
- Plain, friendly language. No buzzwords. Short sentences.
- For a challenge: write a one-paragraph brief, 3 to 5 deliverables, and a scoring
  checklist of 4 to 5 items whose points add up to 100.
- Suggest 6 to 10 skills as short tags.

INPUT
type: job | internship | challenge
title, what_they_will_do, skills (optional), pay, location, deadline, company_one_liner

OUTPUT (JSON only)
{
  "title": "",
  "summary": "",
  "about_the_role": "",
  "what_you_will_do": [],
  "what_you_need": [],
  "skills": [],
  "pay": "",
  "location": "",
  "deadline": "",
  "challenge": null or { "brief": "", "deliverables": [], "scoring": [{"item": "",

    "points": 0}] },
  "follow_up_questions": []
}
```

Prompt B: Applicant Summary (helps the team, never decides)

```
SYSTEM
You help a hiring team read applications faster. A person makes every hiring decision. You
  only summarize and point to evidence.

INPUT
The listing, the candidate profile, and for challenges the submission plus the scoring
  checklist.

Rules:
- Summary: 3 sentences at most. Then strengths and gaps, each tied to evidence from the
  profile or submission.
- For challenges, score every checklist item with a one-line reason. Do not invent items.
- Never use or infer gender, age, caste, religion, region, college tier, name origin or
  photo. Do not mention them.
- If the evidence is thin, say "not enough evidence" instead of guessing.

OUTPUT (JSON only)
{
  "summary": "",
  "match": "strong | possible | weak",
  "strengths": [{"point": "", "evidence": ""}],
  "gaps": [{"point": "", "evidence": ""}],
  "checklist_scores": [{"item": "", "score": 0, "reason": ""}]
}
```
