Hiring Platform: Repo Research and UI Direction

Open-source repos to build on, a recommended stack, and the UI/UX style to follow with your own brand. Reference product: Startupathon (screens in the separate screenshots PDF). Researched 4 Nov 2026.

The short version

No single repo matches this product. It is four things combined: a hiring pipeline, a challenge and submission system, a community chat, and AI resume onboarding. The best approach is to build the app yourself on a modern starter and borrow ideas or code for each piece.

Repos by feature

Feature	Repo	License	Use it for
App shell, dashboard, data tables	next-shadcn-dashboard-starter (7.2k stars)	MIT	The base for your dashboard. Next.js 16, Tailwind v4, shadcn/ui, kanban, chat UI, themes, Cmd+K. Uses Clerk for auth; swap for Supabase auth.
Challenges, attempts, scoring	CTFd (3.8.9, Oct 2026)	Not stated on the page I read; check the repo	Reference for the data model only, not code to fork. Max attempts, submission history, dynamic scoring, teams, brackets.
Hiring pipeline	OpenCATS (PHP/MySQL, 728 stars), FreeATS (Ruby)	FreeATS: MIT. OpenCATS: not stated	Reference only. Old-style back-office tools. Your 5-stage pipeline is a status column in Postgres.
Community chat	Campfire (source: basecamp/once-campfire)	MIT	Self-hosted app with rooms, DMs, @mentions and a PWA. The page did not name its stack; check the repo.
In-app chat	Supabase Realtime Chat block	n/a	One shadcn command to install. It does not store messages, so you need your own messages table.
Full Discord-style apps	Rocket.Chat, Fluxer, Stoat, via OpenAlternative	Rocket.Chat: MIT. Fluxer: AGPL	Only if you want a full Discord clone. Heavy standalone products.
Resume parsing	OpenResume (8.9k stars)	AGPL-3.0	Skip its code. AGPL can force you to open-source your hosted product.

I am assuming "Campfire" in the Startupathon nav is a community chat or feed. That cannot be confirmed from the screenshots alone.

Recommended stack

- **Frontend:** Next.js, Tailwind and shadcn/ui, starting from the dashboard starter above.
- **Backend:** Supabase for auth, Postgres, Realtime and file storage.
- **Resume parsing:** extract the PDF text, then use the Claude API with structured output to fill the profile form (headline, about, skills, education). This avoids the AGPL issue.
- **GitHub repo connect:** a GitHub OAuth app or GitHub App with Octokit. No repo needed.
- **Chat:** start with the Supabase block inside your app. Run Campfire separately only if you want full chat rooms.

UI/UX to borrow, with your own brand

Copy the structure and feel, not their colors.

Onboarding

One question per screen over a soft radial gradient. Centered serif headline with one italic accent word, pill-shaped choice chips, a thin 2-step progress bar, and "Skip for now" in the top right.

Profile review

A single card of stacked labeled fields, skills as removable chips, and one dark "Save & continue" button.

Dashboard

Four stat cards, a photo promo banner, a friendly empty state with one call-to-action, and open roles in a 2-column card grid.

Challenge page

A row of reward chips (cash, equity, perks), a two-column layout with a sticky "Enter" card, numbered "How it works" steps, and a checklist for the scoring rubric.

Assignment page

A 5-stage stepper (Applied, Assignment, Interview, Offer, Hired), badges for attempts and countdown, the video on the left and the submit form on the right, and a soft banner for the next action.

Brand tokens

Define a few tokens and build everything from them. Swapping the accent re-themes the whole app.

```
:root {
  --bg: #FAF8F9;      /* off-white page */
  --ink: #1B1420;     /* headings + primary buttons */
  --accent: /* your brand color */;
  --glow: color-mix(in srgb, var(--accent) 18%, transparent);
  --radius: 16px;
}
.hero {
  background: radial-gradient(60% 50% at 50% 45%,
              var(--glow), var(--bg) 70%);
}
```

Type: a serif for display headings and a clean sans for body text. Corner radii of 12 to 24px and soft shadows.
